

Pymaceuticals Three Observable Trends

1. Among the four treatments (Capomulin, Infubinol, Ketapril, and Placebo), only Capomulin has taken obvious effect and efficiently decreased the tumor volume, all the other three drugs haven't decreased the tumor volume, but Infubinol more or less suppress a little bit the tumor volume increasing speed than Ketapril.
2. Drug Capomulin is also the winner of significantly suppressing the metastatic spread, Infubinol still ranks the second.
3. Capomulin at the same time has the lowest death rate so it's indubitably an efficient drug in treating tumor on mouse. Meanwhile the previously rank 2 Infubinol has the highest death rate, this deprive it from the rank 2 overall.
